FlashRole: Feature Adoption and Job-Search Outcomes

Methodology and Final Report
Prepared by Bamidele Olamilekan Igotun
16 October 2026

Executive summary

FlashRole is an AI-assisted job-search platform that helps users build resumes, check ATS compatibility, match with job postings, generate cover letters and practise interviews. The platform also screens postings for scam risk and offers Free, Premium and Pro plans.

The analysis examined feature engagement, the recorded user journey and the relationship between feature use and application outcomes. The dataset contained 100,000 users and 351,493 applications from 70,224 applicants. Of applicants, 33.13% had at least one application currently marked Interview or Offer, while 9.59% had an Offer. The average ATS score available by application was 66.69 out of 100.

Resume upload and ATS checks recorded 100% adoption, while interview preparation had the lowest adoption at 24.98%. Job matching recorded the highest repeat-use rate among AI features at 98.17%. Cover-letter use started latest, at a median of 150 days after signup.

Applications with and without cover letters or recorded interview preparation had similar outcomes. Higher ATS scores, job-match scores and additional resume revisions were not consistently associated with higher interview and offer rates. The recommendations focus on feature visibility, timely guidance and meaningful use of the tools.

Business context and problem

FlashRole records activity across several job-search tools, but leadership needed a shared view of which features users adopt, how quickly they start and whether they return. The project also addressed uncertainty about progression towards offers and the relationship between feature use, scores, resume revisions and application outcomes.

Project objectives

- Measure feature adoption, repeated use and time to first recorded use.
- Show how many users reach each recorded signup-to-offer milestone.
- Compare interview and offer rates by cover-letter use, ATS bands, job-match bands and preparation.
- Examine whether more recorded resume revisions accompany higher ATS scores and better outcomes.
- Present findings in an interactive Power BI report to guide onboarding and product priorities.

Data Sources and Preparation

The project used nine operational source tables. Fact_activity combined user feature events for engagement analysis, and Dim_Date provided calendar fields within the model.

Source table	Rows loaded	Date coverage	Purpose
users	100,000	30 Dec 2023 - 6 Aug 2026	User profiles, plan tiers and signup dates.
resumes	165,284	31 Dec 2023 - 6 Aug 2026	Resume versions, upload dates and finalisation status.
applications	351,493	3 Jul 2025 - 6 Aug 2026	Applications, linked users/resumes/jobs, statuses and cover-letter flag.
assessments	566,777	1 Jan 2024 - 6 Aug 2026	ATS, job-match and scam-risk assessments.
cover_letters	158,536	17 Jul 2025 - 6 Aug 2026	Cover-letter generation and application links.
interview_sessions	45,037	31 Dec 2023 - 6 Aug 2026	Recorded interview preparation sessions.
job_postings	50,000	2 Jul 2025 - 6 Aug 2026	Job details and company links.
companies	3,000	2 Aug 2023 - 6 Aug 2026	Company characteristics.
scam_flags	2,255	5 Jul 2025 - 6 Aug 2026	Recorded job-posting risk flags.

Data preparation summary

Area	Work completed
Date fields	Converted signup, resume upload, application, assessment, cover-letter generation and interview-session dates to Date.
Numeric fields	Assigned appropriate numeric types to resume versions, salary fields, preparation questions, duration and recorded flags.
Profile fields	Removed user names and email addresses, and the company-name field, from the loaded queries.
Combined activity	Appended resume uploads, applications, cover letters, interview preparation and user-linked ATS/job-match activity into Fact_activity.
Activity dates	Created activity month and elapsed days/months since signup. Records without a user or activity date were excluded from the combined activity table.

Methodology and Metric Definitions

Data model

The model connected users to their applications, resumes, cover letters, preparation sessions and combined activity records. Resume records linked to assessments, while job postings linked to applications and companies. DAX measures and calculated columns supported the KPI cards, journey stages, feature groups and score bands.

Metric definitions

Metric	Calculation / definition
Total users	Distinct registered user IDs.
Total applications	Distinct application IDs.
Adoption rate	Distinct users with recorded activity for a feature divided by total users in the selected context.
Repeat-use rate	Users with at least two recorded uses of a feature divided by adopters of that feature.
Days to first use	Median days from signup to the first recorded use of each feature among adopters.
Journey users	Distinct users recorded at signup, resume creation, resume finalisation, application, interview and offer milestones.
Applicants with an Interview or Offer	Applicants with at least one application currently marked Interview or Offer divided by all applicants.
Applicants with an Offer	Applicants with at least one application currently marked Offer divided by all applicants.
Interview to Offer Rate	Users with an Offer divided by users with an application currently marked Interview or Offer.
Application interview rate	Applications currently marked Interview or Offer divided by applications in the comparison group.
Application offer rate	Applications currently marked Offer divided by applications in the comparison group.
Average ATS score	Mean of available ATS scores attached to applications.

Application comparison groups

Applications were grouped by cover-letter use, ATS score band, job-match score band, interview preparation recorded by the application date and recorded resume revisions. Score bands were Below 40, 40 to below 60, 60 to below 80 and 80 to 100, with unavailable scores shown separately. Recorded revision counts used the maximum resume version recorded for the user by the application date, minus one.

KPI Summary and Feature Engagement

KPI	Value	Meaning
Total users	100,000	Registered users.
Total applications	351,493	Distinct applications.
Applicants with an Interview or Offer	33.13%	Share of applicants with a current Interview or Offer application.
Interview to Offer Rate	28.94%	Share of interview/offer users with an Offer.
Applicants with an Offer	9.59%	Share of applicants with a current Offer application.
Average ATS score available by application	66.69 / 100	Average available application ATS score.

Feature engagement summary

Feature	Adoption rate	Repeat-use rate	Median days to first use
ATS check	100.00%	50.28%	75.00
Resume upload	100.00%	50.28%	73.00
Application	70.22%	98.17%	132.50
Job match	70.22%	98.17%	134.00
Cover letter	63.91%	73.70%	150.00
Interview preparation	24.98%	55.37%	53.00

Insights

Resume upload and ATS checks had the highest recorded adoption at 100%, while interview preparation had the lowest at 24.98%. Job matching had the highest repeat-use rate among AI features at 98.17% of adopters. Cover-letter use started latest, at a median of 150 days after signup.

Recommendation

Improve feature visibility and introduce timely prompts for interview preparation and cover-letter generation.

Recorded Journey and Resume Revisions

Recorded user journey

Milestone	Users
Signed up	100,000
Created resume	100,000
Finalised resume	Approximately 80,000
Applied	70,224
Interview or Offer	Approximately 23,000
Offer	6,733

Of 100,000 users, 70,224 applied and 6,733 reached a recorded offer, representing 9.59% of applicants. The journey visual showed fewer users at the interview and offer milestones than at the application milestone.

Recommendation: Review application-to-interview progression to identify opportunities for better job-search support.

Resume revisions and application outcomes

Recorded revisions	Interview rate	Offer rate
0	8.03%	2.03%
1	7.95%	1.99%
2	8.03%	1.97%

The combo chart compared interview and offer rates alongside average ATS scores across revision groups. Average ATS scores and interview rates were similar across groups. More recorded revisions were not associated with consistently better outcomes.

Recommendation: Encourage meaningful improvements to resume content rather than increasing the number of revisions.

Feature Comparisons and Application Outcomes

Cover letters

Application group	Interview rate	Offer rate
With linked cover letter	7.95%	2.00%
Without linked cover letter	8.05%	2.02%

Applications with and without linked cover letters had similar interview and offer rates. A linked cover letter did not guarantee an interview or offer.

Job-match score bands

Score band	Interview rate	Offer rate
Below 40	8.10%	1.80%
40 to below 60	7.67%	1.92%
60 to below 80	8.25%	2.05%
80 to 100	8.36%	2.15%
Not available	8.01%	2.02%

The highest score band recorded the highest interview rate at 8.36% and offer rate at 2.15%, but outcomes did not improve consistently across all bands.

ATS score bands

Score band	Interview rate	Offer rate
Below 40	7.92%	1.95%
40 to below 60	7.98%	2.04%
60 to below 80	8.05%	2.03%
80 to 100	7.98%	1.94%
Not available	7.93%	2.03%

Interview rates remained around 8% across ATS bands. Higher ATS scores were not consistently associated with more interviews or offers.

Interview preparation

Preparation group	Interview rate	Offer rate
Preparation recorded by application date	8.08%	1.98%
No preparation recorded by application date	7.98%	2.02%

Applications with recorded preparation had similar interview and offer rates to those without it.

Dashboard, Recommendations and Conclusion

Dashboard development

Dashboard page	Content
Feature Adoption	Six KPI cards; adoption, repeat-use and first-use matrix; recorded journey funnel; resume revision combo chart.
Application Outcomes	Interview and offer rate comparisons by cover-letter group, job-match score band, ATS score band and interview preparation group.
Plan Tier slicer	Free, Premium and Pro selections for reviewing engagement and outcomes across plan tiers.

The Power BI report combined headline KPIs with feature and outcome comparisons, giving leadership a shared view of engagement and application progression.

Strategic recommendations

Area	Recommendation
Feature engagement	Improve feature visibility and introduce timely prompts for interview preparation and cover-letter generation.
Application progression	Review application-to-interview progression to identify opportunities for better job-search support.
Cover letters	Position cover letters as supporting application material rather than a promise of better outcomes.
Job matching	Encourage users to consider job requirements alongside match scores when choosing roles.
ATS feedback	Use ATS feedback alongside guidance on relevant skills, experience and resume clarity.
Interview preparation	Offer targeted practice tailored to the role and interview requirements.
Resume revisions	Encourage meaningful improvements to resume content rather than increasing the number of revisions.

Conclusion

FlashRole's analysis showed that feature adoption varied, while recorded use, higher scores and additional resume revisions were not consistently associated with better interview and offer outcomes.

The priority is to help users apply the tools meaningfully through better feature discovery, timely guidance and support focused on relevant job requirements and application quality. The dashboard gives leadership a shared basis for monitoring engagement and outcomes across plan tiers and guiding product improvements, without assuming that greater feature use alone guarantees success.
